

DAY 21 · AI Simplified Series

Stop Settling for Bad AI Outputs

4 iteration tricks that unlock way better results

Hi, I'm Kainat!

Today we learn how to **fix prompts** that miss the mark and get AI to actually deliver.

4

Iteration
Methods

Before vs
After Table

Swipe through all 12 slides →

AI gave you a **meh** answer. Now what?

You iterate. That just means you refine your prompt until AI nails it. It's less about being perfect upfront and more about guiding AI step by step.

Think of it like ordering pizza

"I want pizza" is vague.

"I want a 12-inch veggie pizza, thin crust, extra cheese" gets you exactly what you want.

Always iterate in the same chat so AI remembers context

Each iteration narrows the gap between vague and perfect

4x

better outputs when you iterate instead of restart

Here's the mindset shift:

- ✗ Most people: give up after 1 bad result
- ✓ Smart users: **refine and iterate** in the same chat
- ✓ AI remembers **your previous messages** and builds on them
- ✓ Each follow-up prompt gets you **closer to perfect**

Iteration is your secret weapon. Not a better tool.

Before vs After Iteration

Your Goal	 Without Iteration	 With Iteration
Write a bio	Generic 3-line bio, robotic tone	Personalized bio matching your exact voice
Business ideas	Vague list of obvious ideas	Specific ideas for your skills and city
Study summary	Wall of text, hard to review	Bullet points with examples, under 200 words
Email draft	Formal and stiff, not your style	Casual and clear , reads like you wrote it

Which column are you living in right now? 📍

4 Methods to Fix Any Prompt

When your AI output misses, try one of these 4 moves. We'll go deep on each one next.

01

Revisit the Framework

Add role, format, context and references to your prompt

02

Break it Into Steps

Send one small task per prompt instead of one big ask

03

Rephrase or Reframe

Say the same thing differently or switch to an analogous task

04

Add Constraints

Set limits on length, format, audience or scope

1 Revisit the Prompting Framework

Make sure your prompt has: Task · Persona · Format · Context · References

✗ Too vague

"Identify the latest developments in the restaurant industry."

✓ With framework

"Create a bulleted list of recent restaurant trends in urban areas that could impact a farm-to-table dining experience."

COPY-PASTE TEMPLATE

Act as [role/expert]. Create a [format] about [topic] for [audience]. Include [specific context].

Best for: when the output feels too generic or off-topic

2 Break the Prompt Into Shorter Tasks

Instead of one massive prompt, send 3 small ones in sequence. AI builds on each answer.

1

Prompt 1 — Get the broad list

"List the latest developments in the restaurant industry."

2

Prompt 2 — Narrow it down

"Summarize the trends that would impact restaurants in urban areas."

3

Prompt 3 — Apply your angle

"Write a pros/cons list on how those trends affect a farm-to-table restaurant."

Same chat = AI remembers everything and builds on it!

3 Rephrase or Switch to an Analogous Task

If AI keeps missing the point, say it differently or flip to a similar task that gets a fresh response.

Rephrase it

Explain the same idea using different words or a simpler angle.

e.g. "Explain like I'm new to this field"

Analogous task

Switch the task format entirely to trigger a different kind of thinking from AI.

e.g. "You're the customer. List your concerns."

4 Introduce Constraints

Fewer choices = sharper answers. Constraints actually unlock more creative and precise outputs.

Length

"Keep it under 150 words"

Audience

"Write for a beginner with no tech background"

Format

"Use a numbered list only"

Scope

"Only include examples from 2023 onwards"

WITH CONSTRAINTS:

List restaurant trends in cities of **500k+ people**, only for **vegan restaurants**, from the **last 2 years**.

Best AI Tools for Iterating Prompts

These tools handle multi-turn conversations really well, making iteration smooth and fast.

ChatGPT (GPT-4o)

Excellent memory within a conversation. Great for long iterative research sessions.

Best for: Brainstorming + writing

Claude (Anthropic)

Handles very long context windows. Perfect for refining documents step by step.

Best for: Long documents + analysis

Perplexity AI

Adds real-time web search to every iteration. Great when your topic needs current data.

Best for: Research with fresh facts

Gemini

Deeply integrated with Google products. Ideal for students using Google Workspace.

Best for: Docs, Slides, Google tools

Iteration Cheat Sheet

Save this! You'll use it every single time you prompt.

	Method	Use when...
1	Revisit the Framework	Output feels too generic or vague
2	Break Into Steps	Topic is complex or multi-part
3	Rephrase or Reframe	AI keeps misunderstanding you
4	Add Constraints	Output is too long or off-scope

Pro tip: Always iterate in the same chat. AI memory is your best friend! 🧠

Your 5-Minute Challenge

Put Iteration Into Action

Step 1: **Paste this in any AI tool:**

"List 5 career paths for a software engineering student."

Step 2: **Then send this follow-up:**

"Now filter those paths to ones that can start remotely, and add a beginner resource for each."

1

Send the broad prompt

2

Add a constraint follow-up

3

Notice how the output improves!

Which iteration method will you try first? Comment the number: 1, 2, 3 or 4 🙌
